Stage 1 — detection (GLiNER). entity-type / span similarity matrix (dot product + sigmoid)
Stage 2 — normalization heads (jointly fine-tuned, no freeze; read the native span & type embeddings)
Classification head — categorical
$p(v) \propto \mathrm{MLP}(\bar{\mathbf{h}}_{\mathrm{span}})^{\top}\,\mathbf{e}_v$
pooled span emb. vs. value embedding
e.g. COO test, MYC FISH, sex
Span-selection head — numeric / ordinal / date
$j^{\star} = \arg\max_j s(\mathbf{h}_j, \mathbf{e}_{\mathrm{type}}, c_j) \Rightarrow \mathrm{parse}(\mathrm{span}_{j^{\star}})$
type-conditioned score over candidate spans + exact parse
e.g. height, IPI, diagnosis date
MYC FISH → rearranged
height → 175 cm
date → 2018-06-15
Filled, normalized eCRF (single forward pass)
height 175 (cm)
diagnosis_date 2018-06-15
MYC_FISH rearranged
